Introduction to Section 10 (10a – Grazing Management)

Ultra High Density Grazing (ND) (Feed the Livestock and Soil Biology)

How does Ultra High Stock Density Build Soil?
- More roots in the soil
- Longer rest periods mean more roots
- Withstands droughts better
- Pulls minerals from deeper in the soil

Healthy Soils will be the result of proper grazing management and will keep your pastures sustainable (i.e., producing high quality forage and animals)
