

Section 1 of 22 (1e – Soil Aggregate Stability Demo)

Soil quality – Two samples from the Sanchez farm were compared by immersion in water, on the left from the edge of the field (no improvement to soil quality) and on the right from inside the field with beneficial management practices applied. Sanchez also practices the judicious use of soil amendments such as manure, compost, gypsum, etc. The soil on the right held together, even after 24 hours submersed in the water, indicating aggregate strength and exceptional soil quality.
